

### Imagine the problem

What the solution will be ?!?!

Our project !!!

Photograph Sharing Platform

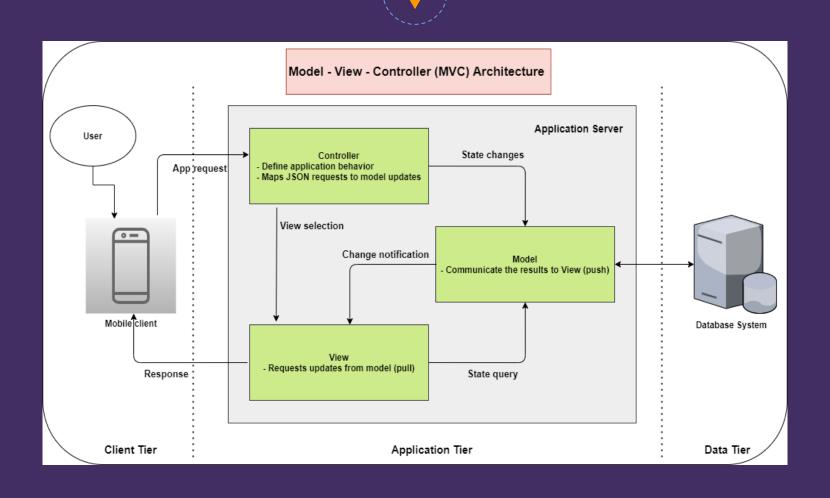

#### Definition:

Photograph sharing platform that allows users to share their photos to the app's feed or with other members in an anonymous way on the platform. Likes & Dislikes work as ratings for a post and these can only be seen by the one who share. Ratings will be good for an artist or photographer for analyzing the people's preferences to art. User's posts will remain permanently. This platform will work also in a matching logic similar to Tinder. Users will be able to rate other users' posts, and the posts with highest ratings will be shown more frequently in the trend. This project is a mobile application, the group will use React native as a frond-end and as a back-end for the database. The database will store various data such as accounts, pictures, likes, dislikes, matches.

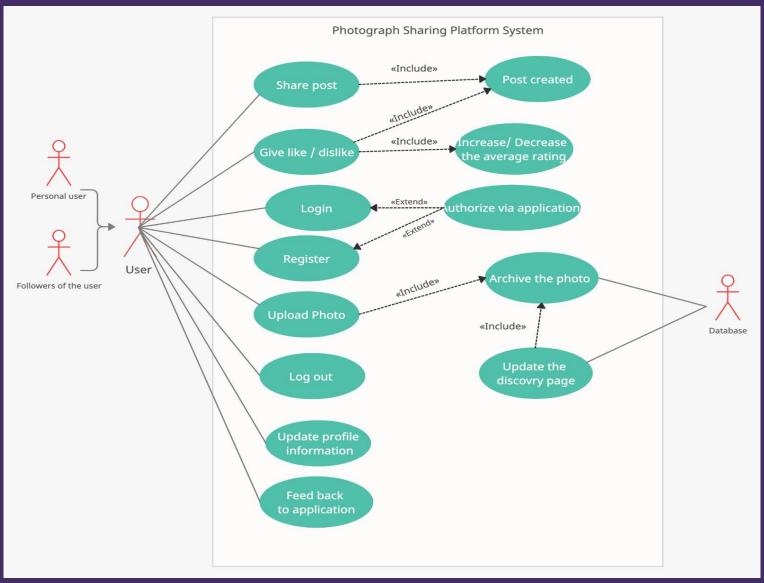

#### Goals:

A media platform where any user can share and rate users' media anonymously. There will be a like / dislike feature for posts which will work as the rating based on the ratio, High rated posts will be shown on the trending page of the app. This app will come in handy mostly for people in the photography industry. The application will be available on IOS and Android systems.
